ABSTRACT

Security is the main aspect nowadays. Without security life is miserable and many thefts can take place any time anywhere. So security is always required in our daily life.

Keeping this in mind video streaming using cell phone with security is proposed to be an innovative tool for solving the above problem and managing the safety of our office or the room which we stay in.

The user can send a message and start the camera whenever required and check what is going in the room. He can check whether there is any intruder in the room at that particular point of time. Using the motion detection it also helps us to know whether trespassing is done in the secured room or the office.

So the outcome of this project will surely help the owner to leave his room or office any time when required without the worry of any people trespassing.

For the above-defined development, we propose to use the Windows environment as well as a database access language such as MSSQL.
