ABSTRACT

Competition keeps innovation going. There are many web browsers available but very few of them are having voice enabled facilities and web developer tools. Voice enable facility will help the URL to navigate faster. With the speed dialing feature the user can give the commands to the browser through numbers also. There will be less chances of typing mistake. If a person wants to take a make a fake printout of the webpage then he/she can edit the content of the webpage by using the editor tool.

Web page editor tool is an added advantage, which helps to edit the content of the web page and save the web page into a web based format. Proposed solution decreases the time span one need to expend for surfing web. By means of the implementation of such a system, the web developers would be able to gain tangible benefits as well as intangible benefits. The package provides more tools in the development tool bar which enhances the scope of web development basically for novice web developers.
