ABSTRACT

Voting is a right of all the citizens. But sometimes it becomes very difficult for the people who are on a move or out of the state or country to cast their vote. Their votes simply go wasted or Proxy. At the same time they lose their valuable right of voting. With electronic media it will be able to replace the manual ballet. Hence we thought of developing a website which will be a solution to this problem. The election commissioner will maintain or administrate this web. For all the places that are undergoing voting, a database of the voters and candidates will be maintained. Once a person cast his/her vote, with proper authentication the re-voting will be prohibited. Once the voting is over, all the counting will be done online and result will be displayed

This method of web Voting can enhance the security and no proxy voting can be done. Here we are using AADHAAR CARD information for authentication. We are using *voters name*, his *aadhaar card number* and the *thumb impression*. Even with the Electronic voting machine, the booth capturing and forced voting persists, but with Web voting tools such things are removed.
