ABSTRACT

Occasionally, we forget to switch off the devices/appliances in our houses. In such situations, we would appreciate some means to control the devices from the current location. The project proposed here implements this idea in a cost efficient manner.

The project proposed is the Android Assisted Remote Home Control System. This project is basically the automation of all the devices of the house and means of controlling it via the cellular device. This system requires input from the user through their android device and passes the information to the micro-controller which is connected to the home personal computer. This device is responsible for controlling the devices/appliances from its end. This implementation can be extended for controlling multiple security devices of the concerned region.
