ABSTRACT

Now a day's mobile is a common device every people can use. By using our application, woman can give intimation to nearby police force for protection. Every woman needs to download our application (free) on her mobile and needs to register.

This application has two signals/commands "UNSAFE". She needs to press (activate) unsafe command. Immediately her contact number, her current location with unsafe (request for protection) signals reaches the server through GPRS and transfer to the nearby police force. As the nearby police force is aware about the local place and can reach the location and protect the unsafe woman. Meanwhile if unsafe woman carries to different place, using her contact number, police force can trace her place and able to give protection.
